Unit â€“ 1 : Session â€“ 4 : SLO â€“ 1 | Kernel Structures â€” Reverse Word Search

I. Words to Place in the Grid

• EXOKERNEL â€” minimalist kernel that exposes hardware to applications, giving them more direct control.
• HYBRID KERNEL â€— combines features of monolithic and microkernels; used in modern OS like Windows and macOS.
• LAYERED â€— organized in levels; each one builds on services provided by the one below it.
• MICROKERNEL â€— only includes essential functions like IPC and basic scheduling; everything else runs in user space.
• MODULAR â€— allows components to be loaded and unloaded at runtime, often used in Linux systems.
• MONOLITHIC â€— single large process running entirely in kernel mode with all OS services included.
• SIMPLE â€— basic structure with minimal functionalities, often used in teaching or early systems.
• VIRTUAL MACHINE â€— creates an abstraction of physical hardware; runs multiple OSes on the same physical system.
