Unit â€“ 1 : Session â€“ 6 : SLO â€“ 2 | Storage Management â€” Unscramble and Concepts

I. Key Terms (unscrambled)

• SECONDARY STORAGE â€” non-volatile storage (HDD, SSD) managed by the OS.
• FILE SYSTEM â€” OS component that organizes files and directories on storage.
• FREE-SPACE MANAGEMENT â€” tracking which disk blocks are free (bitmap, linked list).
• ALLOCATION â€” assigning disk blocks to files: contiguous, linked, or indexed allocation.
• DISK SCHEDULING â€” ordering pending disk I/O requests (FCFS, SSTF, SCAN, C-SCAN).
• CACHING and BUFFERING â€” keeping frequently used data in memory to reduce disk access.

II. Role of the OS in Secondary Storage Management

• The OS manages free space, allocates storage to files, schedules disk requests to minimize
• seek time, and uses caching/buffering to improve I/O performance.
