Unit â€“ 1 : Session â€“ 5 : SLO â€“ 2 | Modular OS and Virtualization â€” Unscramble

I. Unscrambled Words

• uSn -> SUN â€” first half of the example of a modular-structure OS.
• Sslario -> SOLARIS â€” second half; Sun Solaris is the classic modular-structure OS example.
• iVrtual -> VIRTUAL â€” as in Virtual Machine.
• Mnoolith -> MONOLITH â€” the monolithic kernel structure.
• uGest -> GUEST â€” a virtual computer that runs inside a virtual environment on a host machine.
• Htso -> HOST â€” the physical computer system on which the virtual machine software runs.
• Kernle -> KERNEL â€” responsible for all major operations of the operating system.

II. Modular OS and Virtualization Layers

• A modular OS uses loadable kernel modules (LKMs) â€” drivers and services are linked at runtime,
• which lets a virtualization layer (hypervisor) be integrated cleanly, as in Linux KVM.
• The hypervisor runs on the HOST and creates GUEST virtual machines, each with its own OS.
